AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A method for assaying sequence-specific hybridization, said method comprising:
 - providing a target comprising at least one target biopolymer sequence;
 - providing a probe comprising at least one probe biopolymer sequence;
 - adding said probe and said target to a binding medium to provide a test sample;
 - applying a first stimulus to said test sample to provide a first stimulated test sample;
 - detecting a first signal from said first stimulated test sample, wherein said first signal is correlated with a binding affinity between said probe and said target;
 - applying a second stimulus to said first stimulated test sample to provide a second stimulated test sample;
 - detecting a second signal from said second stimulated test sample, wherein said second signal is correlated with said binding affinity between said probe and said target; and
 - comparing said first signal and said second signal to accomplish said assaying;
- wherein: (a) at least one label is provided in said test sample, (b)and said first stimulus, said second stimulus, said first signal and said second signal are photonic or electronic~~electromagnetic radiation~~, (c)~~provided that~~ at least one of said first stimulus and said

Application No. 09/911,047
Amendment Dated August 25, 2004

second stimulus is photonic, and (d) when said first stimulus and said second stimulus are photonic radiation, an intermediate electronic stimulus is applied to said test sample after said first stimulus and before said second stimulus, and when said first stimulus and said second stimulus are electronic radiation, said first signal and said second signal are electric current.

2. (Original) The method of claim 1, wherein said first stimulus is photonic and said second stimulus is electronic.
3. (Original) The method of claim 1, wherein said first stimulus is photonic and said second stimulus is photonic.
4. (Original) The method of claim 1, wherein said first stimulus is electronic and said second stimulus is photonic.
5. (Canceled)
6. (Original) The method of claim 1, wherein application of said second stimulus is at least partially coextensive with application of said first stimulus.
7. (Original) The method of claim 1, wherein said first signal is photonic and said second signal is electronic.
8. (Original) The method of claim 1, wherein said first signal is photonic and said second signal is photonic.
9. (Original) The method of claim 1, wherein said first signal is electronic and said second signal is photonic.
10. (Canceled)

Application No. 09/911,047
Amendment Dated August 25, 2004

11. (Canceled)

12. (Currently Amended) The method of claim 14, wherein at least one of said first stimulus and said second stimulus~~said photonic radiation~~ is a laser beam.

13. (Currently Amended) The method of claim 14, wherein ~~said electronic radiation~~ first stimulus, said second stimulus or said intermediate electronic stimulus is electric voltage.

14. (Original) The method of claim 1, wherein said at least one label transfers energy to at least one other label to generate at least one of said first signal and said second signal.

15. (Original) The method of claim 1, wherein said at least one label is chemiluminescent or electrochemiluminescent.

16. (Original) The method of claim 1, wherein said at least one label is an electron spin label.

17. (Original) The method of claim 1, wherein said probe biopolymer sequence and said target biopolymer sequence contain nucleobases and said probe hybridizes specifically with said target to form a duplex.

18. (Original) The method of claim 1, wherein said probe biopolymer sequence and said target biopolymer sequence contain nucleobases and said probe hybridizes specifically with said target to form a triplex.

19. (Original) The method of claim 1, wherein said probe biopolymer sequence and said target biopolymer sequence contain nucleobases and said probe hybridizes specifically with said target to form a quadruplex.

Application No. 09/911,047
Amendment Dated August 25, 2004
Reply to Office Action of April 9, 2004

20. (Original) The method of claim 1, wherein said probe is a nucleic acid analog containing at least one of an uncharged backbone, a partially charged backbone, a cationic moiety, a crosslinking agent, a crosslinking sidechain and a nucleobase analog.

21. (Original) The method of claim 1, wherein at least one of said probe biopolymer sequence and said target biopolymer sequence contains an amino acid sequence.

22. (Original) The method of claim 1, further comprising:

applying at least one additional stimulus to said second stimulated test sample to provide an additionally stimulated test sample;

detecting at least one additional signal from said additionally stimulated test sample, wherein said at least one additional signal is correlated with said binding affinity between said probe and said target; and

comparing said first signal, said second signal and said at least one additional signal to accomplish said assaying.

23. (Original) The method of claim 22, wherein said first stimulus, said second stimulus and said at least one additional stimulus are different from each other.

24. (Currently Amended) The method of claim 22, wherein at least one of said first ~~signal~~stimulus, said second ~~signal~~stimulus and said at least one additional ~~signal~~stimulus is applied non-continuously.

25. (Currently Amended) The method of claim 1, wherein at least one of said first ~~signal~~stimulus and said second ~~signal~~stimulus is applied non-continuously.

Application No. 09/911,047
Amendment Dated August 25, 2004
Reply to Office Action of April 9, 2004

26. (Original) The method of claim 1, wherein at least one of said probe and said target is bonded to a substrate, surface, partition, membrane or electrode.

27. (Currently Amended) A method for assaying sequence-specific hybridization, said method comprising:

providing a target;

providing a probe, wherein at least one of said probe and said target comprises at least one biopolymer sequence;

adding said probe and said target to a binding medium to provide a test sample;

applying a first stimulus to said test sample to provide a first stimulated test sample;

detecting a first signal from said first stimulated test sample, wherein said first signal is correlated with a binding affinity between said probe and said target;

applying a second stimulus to said first stimulated test sample to provide a second stimulated test sample;

detecting a second signal from said second stimulated test sample, wherein said second signal is correlated with said binding affinity between said probe and said target; and

comparing said first signal and said second signal to accomplish said assaying;

wherein: (a) at least one label is provided in said test sample, (b) and said first stimulus, said second stimulus, said first signal and said second signal are photonic or electronic ~~electromagnetic radiation~~, (c) ~~provided that~~ at least one of said first stimulus and said second stimulus is photonic, and (d) when said first stimulus and said second stimulus are

Application No. 09/911,047
Amendment Dated August 25, 2004

~~photonic radiation~~, an intermediate electronic stimulus is applied to said test sample after said first stimulus and before said second stimulus, ~~and when said first stimulus and said second stimulus are electronic radiation, said first signal and said second signal are electric current.~~

28. (Original) The method of claim 27, wherein at least one of said probe and said target is a protein, a peptide or a lipid membrane.

29. (Original) The method of claim 27, wherein one of said probe or said target is not a biopolymer.
